

Who does not know this problem?!?

... Thrashing noises at the roof

An innovation of BRANDT Edelstahldach GmbH are the so called "thrashing brackets".

In case of metal roofs customers often have problems with thrashing noises when it is windy. It is very important which material the metal skin is made of.

The so called ferrinox® thrashing brackets from BRANDT Edelstahldach GmbH are compatible with every material that is used in metal roofing. The application of stainless steel as a neutral material is an enormous advantage. Furthermore, the brackets can be used individually and punctually at high-noised positions.

Another very important point is the use of a special stainless steel which is a spring stainless steel with an extreme durability. It prevents the disruptive noise disturbance. The expansion is not affected, no matter into which direction.

The ends of our thrashing brackets were consciously curved in order to avoid scratches on the surface.

All together you can say that "After the horse has left the barn..." or better "If the roof once got in disturbance..." these thrashing brackets describe a favourable solution.

We offer our thrashing brackets in bright or on enquiry also in matt-finished layout.
